## Low-Slope Metal Roofing System

Architectural Building Components has built its reputation one roof at a time. As leaders in the metal roofing industry, we've worked with architects, roof consultants and installers since 1988 to identify and solve roofing problems.

Our innovative new Titan 300 roof system is undoubtedly the best low slope metal roofing system on the market today. It's designed to eliminate the two biggest problems in low-slope metal roofing: Panel End Laps and Curbs. The system features a job-site-produced, 3" tall, vertical rib standing seam panel. It can be installed over an open frame on new construction, be retrofitted over a failed existing metal roof by using a Retro-Zee, or even be applied directly to an existing modified, built-up or single-ply roof.

### **The basic criteria for using Titan 300 is:**

- There needs to be enough slope to get the water off the roof (+/- 1/4")
- There should be exterior drainage
- If there are multiple curbs, such as AC units or skylights, they should be lined up in rows parallel to the slope.

To learn more, give us a call or visit our Web site. We'll show you how we can help solve your roofing problems, make your job easier and make you look good.
